

1. The `===` operator is strictly equal and the `==` is not strictly equal. For example: `NaN == False` will return `true` but `NaN === False` will return `false`
2. A closure is being able to reference a specific instance of local variables in an enclosing function.
3. A higher order function is a function that takes another function as an argument or returns another function
4. A query selector selects an element that matches a css selector. For example: `document.querySelector("p")` gives you the first p element in your document
